

Enhanced Patient Comfort with the Hygoformic Saliva Ejector

JH Orsing AB was founded in the late 1950's by John Orsing, an engineer with a passion for invention. After a visit to the dentist where he endured some troubles with the equipment used, he set his sights on revolutionising the dental industry.

Today, over 60 years later, they are still producing one of the world's finest and best-known mouldable saliva ejectors, the Hygoformic, as well as a wide range of world class technologies to enhance the quality of dental equipment.

The Hygoformic Saliva Ejector offers complete control and client comfort, coming in two different sizes for both adults and children. Being mouldable, it easily adapts to any patient's cheek and being designed with multiple suction holes, it offers unbeatable usability, even if further treatment is planned at the back of the jaw and no aspirator tube is available. With an easy-to-use double adaptor, joining two Hygoformic Saliva Ejectors allows you to easily work both lingually and buccally. The Hygoformic is made up of a mixture of Polyethylene and Polypropylene and is nontoxic and non-pollutive.

The Hygovac range of aspirator tubes are renowned for their ease of use, starting with the traditional Hygovac which is a normal aspirator tube with a 45° cut on one side and an S-cut on the other. Hygovac Vent is a double ventilated aspirator tube. Having the traditional 45° cut on one end and an S-cut on the other, it significantly increases patient comfort and being double ventilated, it reduces getting stuck as often. Also, in the Hygovac family is the Hygovac Green. Being similar in design and style as its blue striped Vent counterpart, this green Polypropylene aspirator is further enhanced by also being autoclavable.

The Hygosurge range of aspirator tips has an apex of only 3,6mm which not only eases dealings with narrow operations but also assists in more comfortable work when holding the Hygovac range of aspirators. The Hygosurge and Hygosurge XL are both autoclavable and the XL fits on 11mm systems for maximum flexibility.

Adding onto the comfort factor of the Hygosurge range, the autoclavable Microtip allows for finer endodontic work as well as micro-oral surgery making it the perfect microsurgery aspirator tip.

Using the Hygojet aspirator tips were created with ease of use in mind. Dentists can now easily reach due to the ergonomic design which holds back the tongue as well as the cheek. The Hygotip makes for easy dealings with children and smaller patients due to the small design and comfort level.

Various adapters allow for Hygovac, Hygosurge XL and other aspirator tubes to fit a 16mm system. Being autoclavable makes for easy and no fuss cleaning.
